# Career Pathways and the Future of Low-Code Development

# Four myths about low-code

| Myth | Reality |
| --- | --- |
| It will replace developers | It shifts developers toward design, integration and review |
| It is only for beginners | Experts use it to deliver faster and save time for hard problems |
| No coding is ever needed | Real apps still use scripting, APIs and careful data design |
| It only makes toy apps | Companies run real business processes on it |

# One app, six careers

Example: the Student Skill Development Tracker from our lab

### Business analyst

Defines which skills to track and why

### Low-code developer

Builds the forms, workflow and reports

### Solution architect

Designs the data model and integrations

### Administrator

Sets roles, permissions and deployment

### Pro-code developer

Writes the scoring function on Catalyst

### AI developer

Adds an LLM assistant for skill advice

# A career ladder

STEP 1

### Junior developer

Builds forms and reports from a spec

STEP 2

### Low-code developer

Owns workflows, scripts and deployment

STEP 3

### Integration engineer

Connects apps through APIs and Catalyst

STEP 4

### Solution architect

Designs secure, scalable systems

STEP 5

### Platform lead

Runs governance and a Centre of Excellence

# My first 12 months

**Months 1 to 3**

## Learn the platform

Forms, reports, workflows and Deluge basics

**Months 4 to 6**

## Build three apps

Small projects used by real people

**Months 7 to 9**

## Go deeper

REST APIs, Catalyst functions and security

**Months 10 to 12**

## Prove it

Certification, internship and hackathons

# Four portfolio projects

### Skill tracker with scoring

Creator forms plus a Catalyst function that assigns each student a level.

### Vehicle service booking

Appointments, approvals and status reports for a service centre.

### Helpdesk with AI triage

An LLM suggests a category and a draft reply for each ticket.

### Purchase approvals

Multi-step approvals with role-based dashboards.

# Where low-code is heading

### Today

Visual builders with scripting, templates and integrations

### Next

AI drafts forms, workflows and code from a plain-language prompt

### Likely later

AI agents run parts of business processes inside the apps

# Low-code or pro-code?

## Choose low-code when

- The process is forms and approvals
- Speed matters most
- Business users need to adjust it

## Choose pro-code when

- Load is very high or real time
- Logic is heavy or algorithmic
- You need full control of hosting

# Build fast, then go deep.

The strongest low-code careers pair quick delivery on the platform with real skill in data, APIs, security and AI.
